

Address Resolution Protocol (ARP)

This protocol enables the IP layer to associate to hosts their physical addresses.

ARP/RARP interface IP to the underlying Data Link protocols

ARP tables

ARP maintains a dynamic table of IP address / Hardware address pairs.

This table is made available to the IP layer for address resolution purposes

ARP cache

A limited number of previous IP address / Hardware address pairs are kept in a cache for future use.

Then, IP may perform address resolution without real ARP queries over the network

ARP under DOS

```
C:\WINDOWS>arp -a
No ARP Entries Found
C:\WINDOWS>ping dora
Pinging dora.di.unito.it [130.192.239.28]
Reply from 130.192.239.28: bytes=32 time=1ms TTL=255
C:\WINDOWS>arp -a
Interface: 130.192.239.122

    Internet Address      Physical Address    Type
    -----
    130.192.239.1         08-00-20-21-66-26  dynamic
    130.192.239.28        08-00-20-20-e6-06  dynamic
```

ARP under UnixTM

See *commands.txt* for sample output

Do *man arp* for the arp command, for viewing the arp table (*arp -a*), adding (*arp -s*) and deleting (*arp -d*) entries.

ARP format

2 2 1 1 2 6 4 6 4
ht pt hs ps op sh sip th tip

ht: hardware type (1 for Ethernet)
pt: protocol type (0x800 for IP)
hs: hardware address size (6 for Ethernet)
ps: protocol address size (4 for IP)
op: 1 for ARP request, 2 for reply
sh, th: sender and target hardware address
sip, tip: sender and target IP address

28 bits
ARP packet

Example: ARP request

ETHER: ----- Ether Header -----
 ETHER:
 ETHER: Packet 2 arrived at 15:15:47.92
 ETHER: Packet size = 60 bytes
 ETHER: Destination = ff:ff:ff:ff:ff:ff, (broadcast)
 ETHER: Source = 8:0:20:21:66:26, Sun
 ETHER: Ethertype = 0806 (ARP)
 ETHER:
 ARP: ----- ARP/RARP Frame -----
 ARP: ... next slide

Example: ARP request

ETHER: ... previous slide
 ARP: ----- ARP/RARP Frame -----
 ARP: Hardware type = 1
 ARP: Protocol type = 0800 (IP)
 ARP: Length of hardware address = 6 bytes
 ARP: Length of protocol address = 4 bytes
 ARP: Opcode 1 (ARP Request)
 ARP: Sender's hardware address = 8:0:20:21:66:26
 ARP: Sender's protocol address = 130.192.239.1, pianeta
 ARP: Target hardware address = ?
 ARP: Target protocol address = 130.192.239.181, paros

Proxy ARP

A computer may advertise its hardware address not only for its own IP number, but also for the IP numbers of other hosts, thus acting as a proxy ARP agent.

Proxy ARP

Reverse ARP (RARP)

Used for booting diskless workstations: the hardware address can be read from the interface card, as is broadcast to the local network with an RARP request. An IP address for the local workstation is thus obtained from a server [RFC 903].

RARP format

2 2 1 1 2 6 4 6 4
ht pt hs ps op sh sip th tip

ht: hardware type (1 for Ethernet)
pt: protocol type (0x800 for IP)
hs: hardware address size (6 for Ethernet)
ps: protocol address size (4 for IP)
op: 3 for RARP request, 4 for reply
sh, th: sender and target hardware address
sip, tip: sender and target IP address

28 bits
RARP packet

Internet Control Message Protocol (ICMP)

Internet Control Message Protocol (ICMP)

Used for handling Network layer error conditions of different kinds. An ICMP message is returned to the sender of the IP datagram that caused the delivery problems.

The ICMP message is sent within an IP datagram, after the IP header.

ICMP format

ICMP type

1 1 2 N
type code checksum contents

- | | |
|---------------------------|-------------------------|
| 0 echo reply (ping) | 11 time exceeded |
| 3 destination unreachable | 12 parameter problem |
| 4 source quench | 13 timestamp request |
| 8 echo request | 14 timestamp reply |
| 9 router advertisement | 17 address mask request |
| 10 router solicitation | 18 address mask reply |

15 ICMP codes for type 3

1 1 2 N
type code checksum contents

- type 3: destination unreachable
- | | |
|--|------------------------------|
| 0 network | 5 source route failed |
| 1 host | 6 destination net unknown |
| 2 protocol | 7 destination host unknown |
| 3 port | 9 destination net disallowed |
| 4 fragmentation needed, but disallowed | |

15 ICMP codes for type 3

1	1	2	N
type	code	checksum	contents
type 3: destination unreachable	10		destination host disallowed
	11		network unreachable for TOS
	12		host unreachable for TOS
	13		disallowed by filtering
	14		host precedence violation
	15		precedence cutoff

Computer Networks - F. Bergadano 3.3.19

ICMP address mask request/reply

1	1	2	2	3	4
		checksum	id	sequence	subnet mask
17	0				
18	0				

17 = request
18 = reply

Used by diskless stations to obtain their subnet mask at bootstrap

Computer Networks - F. Bergadano 3.3.20

Exercise

Run TCPdump;
Start an Xterminal and obtain the ICMP address mask request and reply over the Ethernet

Computer Networks - F. Bergadano 3.3.21

ICMP destination unreachable

1	1	2	4	N
3	code	checksum	0	originating IP data

IP header (20 bytes) +
IP header options +
initial 8 bytes of data
in the IP datagram (thus
including TCP or UDP port)

Computer Networks - F. Bergadano 3.3.22

Exercise

Run TCPdump;
Telnet to a non-existing host, obtain an ICMP unreachable error message.

Computer Networks - F. Bergadano 3.3.23

ICMP time exceeded

1	1	2	4	N
11	code	checksum	0	originating IP data

Returned to sender when TTL has expired in the IP datagram

IP header (20 bytes) +
IP header options +
initial 8 bytes of data
in the IP datagram (thus
including TCP or UDP port)

Computer Networks - F. Bergadano 3.3.24

Exercise

Using TCPdump and TTCP, implement a Traceroute program.

Hint: set TTL to 1 in TTCP with UDP datagrams to obtain an ICMP time exceeded error from the first route; set TTL to 2 for the second router, etc., until the desired host is reached. Use UDP port 50,000, so that “port unreachable” is returned when the final host is reached.
